

Press Release 18.05.08

Coldharbour has recently delivered the latest of a series of orders for Domestic Water Modules (DWM) that it has been manufacturing for the specialist luxury super yacht market. The skid mounted units were designed to supply hot and cold water on board a 96 meter yacht currently nearing completion in a UK yard.

Coldharbour Operations manager Mark Wells said “These DWMs were particularly tricky to design because they had to be configured to fit into the existing confined spaces that were available on board without causing any reduction in their performance. Clients for these types of unit do not accept compromises!”

This is the third set of DWMs that Coldharbour have supplied to the luxury super yacht market in recent years and the company is rapidly establishing a strong reputation for its expertise and quality in this sector.

Mark Wells adds “Coldharbour DWMs are always designed specifically for the client vessel. It is the only way that we can ensure optimal installation and performance on board. One size most definitely does not fit all”
